The Icd-10 Classification Of Mental & Behavioural Disorders: Clinical Descriptions And Diagnostic Guidelines, 1/Ed.

The ICD-10 Classification of Mental and Behavioural Disorders Clinical Descriptions and Diagnostic Guidelines

World Health Organization Provides clinical descriptions diagnostic guidelines and codes for all mental and behavioural disorders commonly encountered in clinical psychiatry. The book was developed from chapter V of the Tenth Revision of the International Statistical Classification of Diseases and Related Health Problems (ICD-10). The clinical descriptions and diagnostic guidelines were finalized after field testing by over 700 clinicians and researchers in 110 institutes in 40 countries making this book the product of the largest ever research effort designed to improve psychiatric diagnosis. Every effort has been made to define categories whose existence is scientifically justifiable as well as clinically useful. The classification divides disorders into ten groups according to major common themes or descriptive likeness a new feature which makes for increased convenience of use. For each disorder the book provides a full description of the main clinical features and all other important but less specific associated features. Diagnostic guidelines indicate the number balance and duration of symptoms usually required before a confident diagnosis can be made. Inclusion and exclusion criteria are also provided together with conditions to be considered in differential diagnosis. The guidelines are worded so that a degree of flexibility is retained for diagnostic decisions in clinical work particularly in the situation where provisional diagnosis may have to be made before the clinical picture is entirely clear or information is complete. ... Pocket Guide to the ICD-10 Classification of Mental and Behavioural Disorders With Glossary and Diagnostic Criteria for Research

A pocket-book version of the new international psychiatric classification produced by the World Health Organizations (WHO), Geneva. This is chapter 5 of the 10th version of the International Classification of Diseases (ICD-10). The guide is designed to be an inexpensive, quick and accessible reference to the WHO compiled classification system (ICD-10) for psychiatric and behavioural disorders. This work brings together the glossary with the diagnostic criteria for research and diagnostic notes extrapolated from the diagnostic criteria. The new classification should appeal to many user types - clinical psychiatrists in training and practice, researchers, medical records clerks and administrators. Classification of diagnosis in psychiatry is based on the patient's clinical history and observed behaviour pattern. At present there are two classification systems used worldwide: ICD (WHO, Geneva) and DSM (American Psychiatric Association, USA). Both systems are presently being revised.

Diagnostic Criteria for Research

World Health Organization Sets out internationally-agreed diagnostic criteria specifically designed for use when conducting research on mental and behavioural disorders. Deliberately restrictive the criteria are intended to facilitate the selection of groups of individuals whose symptoms and other characteristics resemble each other in clearly stated ways and thus to maximize the homogeneity of study groups and the comparability of findings in multicentre and international studies. The book which covers over 300 disorders is derived from chapter V(F) of the Tenth Revision of the International Statistical Classification of Diseases and Related Health Problems (ICD-10). The research criteria were developed in collaboration with the world's leading experts and finalized after testing by researchers and clinicians in 32 countries representing all the major traditions and schools of psychiatry. Descriptions of clinical concepts upon which the research criteria are based are contained in the companion volume Clinical Descriptions and Diagnostic Guidelines. For each disorder criteria are labelled with letters or numbers to indicate their place in a hierarchy of generality and importance. This hierarchy includes general criteria which must be fulfilled by all members of a group of disorders obligatory criteria for individual disorders and further groups and sub-groups of characteristics of which only some are required for the diagnosis. Where appropriate the most commonly used exclusion clause is also listed. A number of disorders of uncertain or provisional status are described in two annexes. The first covers affective disorders that have been the subject of recent research together with certain personality disorders. The second describes several disorders that seem to appear almost exclusively in particular cultures.

The second group of papers typically review international experience with current diagnostic systems. The third set delves into some of the key conceptual bases for the development of future diagnostic systems. The fourth group review ongoing work on adaptations of and complements to the ICD. The last section offers incisive commentaries on integrative approaches and future steps. Summarizing the current knowledge of the field of the international system for classification and diagnosis this publication is essential reading for psychiatrists, psychologists as well as public health services.

Space, Place and Mental Health

Routledge There is a strong case today for a specific focus on mental public health and its relation to social and physical environments. From a public health perspective, we now appreciate the enormous significance of mental distress and illness as causes of disability and impairment. Stress and anxiety, and other mental illnesses are linked to risks in the environment. This book questions how and why the social and physical environment matters for mental health and psychological wellbeing in human populations. While putting forward a number of different points of view, there is a particular emphasis on ideas and research from health geography, which conceptualises space and place in ways that provide a distinctive focus on the interactions between people and their social and physical environment. The book begins with an overview of a rich body of theory and research from sociology, psychology, social epidemiology, social psychiatry and neuroscience, considering arguments concerning 'mind-body dualism', and presenting a conceptual framework for studying how attributes of 'space' and 'place' are associated with human mental wellbeing. It goes on to look in detail at how our mental health is associated with material, or physical, aspects of our environment (such as 'natural' and built landscapes), with social environments (involving social relationships in communities), and with symbolic and imagined spaces (representing the personal, cultural and spiritual meanings of places). These relationships are shown to be complex, with potential to be beneficial or hazardous for mental health. The final chapters of the book consider spaces of care and the implications of space and place for public mental health policy, offering a broader view of how mental health might be improved at the population level. With boxed case studies of specific research ideas and methods, chapter summaries and suggestions for introductory reading, this book offers a comprehensive introduction which will be valuable for students of health geography, public health, sociology and anthropology of health and illness. It also provides an interdisciplinary review of the literature, by the author and by other writers, to frame a discussion of issues that challenge more advanced researchers in these fields.

A Companion to the Classification of Mental Disorders

OUP Oxford A Companion to the Classification of Mental Disorders provides essential reading as a background and supplement to both the recently produced DSM-5 and the forthcoming ICD-11. It focuses on the processes of classification and diagnosis, and the uses for these classifications. The book emphasises the dangers of regarding any current psychiatric classification as true or complete, in view of the present partial state of knowledge about the causes and mechanisms of most mental and behavioural disorders. This book is unique in containing a number of chapters that give a brief history of the cooperative efforts and projects necessary for the production of internationally agreed psychiatric classifications. The discussion begins in 1965 with the US/UK Diagnostic study, the preparations for ICD-8 with its first international glossary, and the International Pilot Study of Schizophrenia, designed and coordinated by the World Health Organization. While recognizing the importance of the innovations of the DSM series of classifications of the American Psychiatric Association, the book also takes a truly international perspective. The expert authors are well placed to do this, having been personally involved in many of the collaborative studies and developments discussed. A Companion to the Classification of Mental Disorders is an illustration of how much international collaborative work has been necessary over several decades to produce the currently agreed classifications. There is still a long way to go, but a start has been made.

Gender and Mental Health

NYU Press Whether in the form of the ongoing automotive wars, books and films such as Michael Crichton's *Rising Sun*, or George Bush's ill-fated trip to Japan in 1991, frictions between the United States and Japan have been steadily on the rise. Americans are bombarded with images of Japan's fundamental difference; at the same time, voices in Japan call for a Japan That Can Say No. If the guiding principle of the Clinton administration is indeed new values for a new generation, how will this be reflected in U.S.-Japanese relations? Convinced that no true solution to U.S.-Japanese frictions can be achieved without tracing these frictions back to their origin, Ryuzo Sato here draws on a binational experience that spans three decades in both the Japanese and American business and academic communities to do just that. In an attempt to bridge the communication gap between the two countries and dispel some of the mutual ignorance and misunderstanding that prevails between the two, Sato addresses the following questions: --Is Japan really different? --Has America's sun set? --How have conflicting views on the role of government affected U.S.-Japan relations? --What are the real differences in American and Japanese industrial policies? --What is the anatomy of U.S.-Japanese antagonisms? --What effect has the collapse of the bubble economy had on relations? --What is Japan's future course? Is it truly a technological superpower? Can it avoid international isolation? An incisive personal look at one of the most important political and economic global relationships, written by a major player in the world of international business and finance, *THE CHRYSANTHEMUM AND THE EAGLE* provides a readable and engaging tour of U.S.-Japan relations, past and present.

Children with Mental Disorder and the Law

A Guide to Law and Practice

Jessica Kingsley Publishers Children and young people with complex mental health needs are increasingly being cared for within specialist mental health care settings, either in the community or in in-patient facilities. With rapid social developments, it can be difficult for carers and practitioners to keep track of the law in this area. This book provides a guide to the law relating to mental health care for children and young people, their rights and entitlement to service, and discusses important issues in clinical and social care practice such as parental responsibility, Gillick competency and capacity, emergency intervention and detention, assessment of mental illness and confidentiality in practice. Jargon-free and accessibly written, this is an invaluable guide for professionals working in child and adolescent health and social care, social workers, youth workers, social welfare policy makers, medical professionals, teachers, educational professionals and students, as well as advocates for children and young people.
