THE NATURE OF DIFFERENCE

SCIENCE, SOCIETY AND HUMAN BIOLOGY (PBK)

[CRC Press](#) Unprecedented advances in genetics and biotechnology have brought profound new insights into human biological variation. These present challenges and opportunities for understanding the origins of human nature, the nature of difference, and the social practices these sustain. This provides an opportunity for cooperation between the biological and social sciences - one that is capable of prompting a synergistic exchange of ideas with far-reaching implications. The Nature of Differencecritically analyses biological explanations for morality, criminality, race, sexuality, and disability. Based on the 45th annual symposium of the Society for the Study of Human Biology, this work synthesizes the perspectives of established experts in the field of human biology with those studying the social meanings of human biological variation and scientific practices in human biological research. Some questions addressed by The Nature of Difference: · Is there a biological basis for morality, criminality, witchcraft, sexuality or disability? · What do comparisons of humans and apes tell us about society? · How do people draw on scientific methods to justify racism? · Why do geneticists continue to use racial categories in their research? · Do ethical guidelines constrain or facilitate research into human biology? · Can science and society escape from biological determinism? As biotechnology expands the frontiers of what we know and what we are able to do, and as the genomic revolution moves out of the laboratory and into our daily lives, we are faced with a number of pressing social issues that need to be resolved. Offering an unparalleled collection of multidisciplinary perspectives on the meanings of biological diversity, this book provides readers with a vibrant analysis which revisits these issues with deepened insight from contrasting yet complementary perspectives.

DARWINIAN NATURAL RIGHT

THE BIOLOGICAL ETHICS OF HUMAN NATURE

[SUNY Press](#) This book shows how Darwinian biology supports an Aristotelian view of ethics as rooted in human nature. Defending a conception of "Darwinian natural right" based on the claim that the good is the desirable, the author argues that there are at least twenty natural desires that are universal to all human societies because they are based in human biology. The satisfaction of these natural desires constitutes a universal standard for judging social practice as either fulfilling or frustrating human nature, although prudence is required in judging what is best for particular circumstances. The author studies the familial bonding of parents and children and the conjugal bonding of men and women as illustrating social behavior that conforms to Darwinian natural right. He also studies slavery and psychopathy as illustrating social behavior that contradicts Darwinian natural right. He argues as well that the natural moral sense does not require religious belief, although such belief can sometimes reinforce the dictates of nature.

DISCOVERY AND EXPLANATION IN BIOLOGY AND MEDICINE

[University of Chicago Press](#) Kenneth F. Schaffner compares the practice of biological and medical research and shows how traditional topics in philosophy of science—such as the nature of theories and of explanation—can illuminate the life sciences. While Schaffner pays some attention to the conceptual questions of evolutionary biology, his chief focus is on the examples that immunology, human genetics, neuroscience, and internal medicine provide for examinations of the way scientists develop, examine, test, and apply theories. Although traditional philosophy of science has regarded scientific discovery—the questions of creativity in science—as a subject for psychological rather than philosophical study, Schaffner argues that recent work in cognitive science and artificial intelligence enables researchers to rationally analyze the nature of discovery. As a philosopher of science who holds an M.D., he has examined biomedical work from the inside and uses detailed examples from the entire range of the life sciences to support the semantic approach to scientific theories, addressing whether there are "laws" in the life sciences as there are in the physical sciences. Schaffner's novel use of philosophical tools to deal with scientific research in all of its complexity provides a distinctive angle on basic questions of scientific evaluation and explanation.

ESSENTIALS OF GLYCOBIOLOGY

BIOLOGY OF WASTEWATER TREATMENT

[Series on Environmental Scienc](#) This comprehensive text provides the reader with both a detailed reference and a unified course on wastewater treatment. Aimed at scientists and engineers, it deals with the environmental and biological aspects of wastewater treatment

and sludge disposal. The book starts by examining the nature of wastewaters and how they are oxidized in the natural environment. An introductory chapter deals with wastewater treatment systems and examines how natural principles have been harnessed by man to treat his own waste in specialist reactors. The role of organisms is considered by looking at kinetics, metabolism and the different types of micro-organisms involved. All the major biological process groups are examined in detail, in highly referenced chapters; they include fixed film reactors, activated sludge, stabilization ponds, anaerobic systems and vegetative processes. Sludge treatment and disposal is examined with particular reference to the environmental problems associated with the various disposal routes. A comprehensive chapter on public health looks at the important waterborne organisms associated with disease, as well as removal processes within treatment systems. Biotechnology has had an enormous impact on wastewater treatment at every level, and this is explored in terms of resource reuse, biological conversion processes and environmental protection. Finally, there is a short concluding chapter that looks at the sustainability of waste water treatment. The text is fully illustrated and supported by over 3000 references.

STORM OVER BIOLOGY

ESSAYS ON SCIENCE, SENTIMENT, AND PUBLIC POLICY

[Prometheus](#) This book had its genesis in Dr. Davis' remarkable editorial in the New England Journal of Medicine that sharply criticized medical schools for lowering their standards of admission to fill minority quotas and ultimately risking the lives of patients. Davis' position (widely held, but seldom articulated) is that the standard of medical care is an even higher ideal than the redress of past racial injustice. A passionate battle is now being fought in our universities over the freedom to pursue ideals of objectivity and intellectual freedom that are incompatible with the mandates of a pragmatic social policy. Storm Over Biology examines many of the areas where scientific and social interests intersect and often conflict, such as genetic engineering and sociobiology. The essays are grouped under six headings: Genetics, Racism and Affirmative Action; Objectivity and Science; Evolution - Sociobiology, Ethics, and Molecular Genetics; Medical Education and Affirmative Action; Public Concern Over Science; and Genetic Engineering. Though trained and best known as a microbiologist, Bernard D. Davis addresses these issues philosophically. He emphasizes both the limitations of science and its enormous power to shape and inextricably alter our lives.

SYNTHETIC DYES IN BIOLOGY, MEDICINE AND CHEMISTRY

[Elsevier](#) Synthetic Dyes in Biology, Medicine and Chemistry is a guide in selecting dyes for special purposes in biology, medicine, chemistry, and other related fields. It aims to help professionals including histologists, cytologists, and other biology and medicine experts, such as chemists and general scientists. The dyes discussed in this book are categorized in 17 different classes according to the nature of their salt-forming sidechains, the colligators. This book also presents the uses of each dye. The spectral curve, which is the ionic and/or molecular weight of each dye, is also covered in this book. Likewise, this text provides the structural and empirical formulae of the spectral curve. Part I tackles various groups of dyes. These groups are the non-ionic, anionic, and cationic dyes. The anionic dyes are further grouped as wholly acid, weakly amphoteric, and moderately or strongly amphoteric. The subsequent part deals with the examples of dyes that do not fit the categories mentioned in Part I. These miscellaneous dyes are vat, reactive, disperse, and ingrain dyes. Part III presents the dyes in different tables according to wavelength of maximum absorption and ionic or molecular weight. This book also covers the stabilized diazonium salts and substituted naphthols.

FREE RADICALS IN BIOLOGY AND MEDICINE

[Oxford University Press](#) Free Radicals in Biology and Medicine has become a classic text in the field of free radical and antioxidant research. Now in its fifth edition, the book has been comprehensively rewritten and updated whilst maintaining the clarity of its predecessors. Two new chapters discuss 'in vivo' and 'dietary' antioxidants, the first emphasising the role of peroxiredoxins and integrated defence mechanisms which allow useful roles for ROS, and the second containing new information on the role of fruits, vegetables, and vitamins in health and disease. This new edition also contains expanded coverage of the mechanisms of oxidative damage to lipids, DNA, and proteins (and the repair of such damage), and the roles played by reactive species in signal transduction, cell survival, death, human reproduction, defence mechanisms of animals and plants against pathogens, and other important biological events. The methodologies available to measure reactive species and oxidative damage (and their potential pitfalls) have been fully updated, as have the topics of phagocyte ROS production, NADPH oxidase enzymes, and toxicology. There is a detailed and critical evaluation of the role of free radicals and other reactive species in human diseases, especially cancer, cardiovascular, chronic inflammatory and neurodegenerative diseases. New aspects of ageing are discussed in the context of the free radical theory of ageing. This book is recommended as a comprehensive introduction to the field for students, educators, clinicians, and researchers. It will also be an invaluable companion to all those interested in the role of free radicals in the life and biomedical sciences.

STRUCTURAL COLORS IN THE REALM OF NATURE

[World Scientific](#) Structural colorations originate from self-organized microstructures, which interact with light in a complex way to produce brilliant colors seen everywhere in nature. Research in this field is extremely new and has been rapidly growing in the last 10 years, because the elaborate structures created in nature can now be fabricated through various types of nanotechnologies. Indeed, a fundamental book covering this field from biological, physical, and engineering viewpoints has long been expected. Coloring in nature comes mostly from inherent colors of materials, though it sometimes has a purely physical origin such as diffraction or interference of light. The latter, called structural color or iridescence, has long been a problem of scientific interest. Recently, structural colors have attracted great interest because various photonic architectures, now developing in modern technologies, have been spontaneously created in the self-organization process and have been extensively used as one of the important visual functions. In this book, the fundamental optical properties underlying structural colors are explained, and these mysteries of nature are surveyed from the viewpoint of biological diversity and according to their sophisticated structures. The book proposes a general principle of structural colors based on the structural hierarchy and presents up-to-date applications.

PERCEIVING IN DEPTH, VOLUME 1: BASIC MECHANISMS

Oxford University Press The three-volume work Perceiving in Depth is a sequel to Binocular Vision and Stereopsis and to Seeing in Depth, both by Ian P. Howard and Brian J. Rogers. This work is much broader in scope than the previous books and includes mechanisms of depth perception by all senses, including aural, electrosensory organs, and the somatosensory system. Volume 1 reviews sensory coding, psychophysical and analytic procedures, and basic visual mechanisms. Volume 2 reviews stereoscopic vision. Volume 3 reviews all mechanisms of depth perception other than stereoscopic vision. The three volumes are extensively illustrated and referenced and provide the most detailed review of all aspects of perceiving the three-dimensional world. Volume 1 starts with a review of the history of visual science from the ancient Greeks to the early 20th century with special attention devoted to the discovery of the principles of perspective and stereoscopic vision. The first chapter also contains an account of early visual display systems, such as panoramas and peepshows, and the development of stereoscopes and stereophotography. A chapter on the psychophysical and analytic procedures used in investigations of depth perception is followed by a chapter on sensory coding and the geometry of visual space. An account of the structure and physiology of the primate visual system proceeds from the eye through the LGN to the visual cortex and higher visual centers. This is followed by a review of the evolution of visual systems and of the development of the mammalian visual system in the embryonic and post-natal periods, with an emphasis on experience-dependent neural plasticity. An account of the development of perceptual functions, especially depth perception, is followed by a review of the effects of early visual deprivation during the critical period of neural plasticity on amblyopia and other defects in depth perception. Volume 1 ends with accounts of the accommodation mechanism of the human eye and vergence eye movements.

HUMAN NATURE EXPLORED

Oxford University Press, USA What exactly is human nature? Are we correct in accepting ourselves as unchangeable, determined by biology, or is this idea an obstacle to our cognitive, emotional, and evolutionary development? George Mandler explores these questions from a fresh evolutionary and social perspective. He examines the burgeoning field of evolutionary psychology and suggests a mid-course correction. Topics are approached from a variety of backgrounds, drawing on relevant literature and Mandler's own research. He begins with what we know about evolution and gene expression, then moves on to the complex phenomena of consciousness and emotion. The constraints of both nature and nurture are discussed as limiting forces on human development, and natural selection is considered in the context of our social fabric, which draws on both psychological and anthropological knowledge. Mandler considers human difference, particularly in regard to intelligence and gender, and discusses the nature of human values, including our need for morality and freedom. The book concludes with an appraisal of human cognition and language.
