People Can't Drive You Crazy If You Don't Give Them the Keys

Baker Books Strange as it may seem, other people are not nearly as committed to our happiness as we are. In fact, sometimes they seem like they're on a mission to make us miserable! There's always that one person. The one who hijacks your emotions and makes you crazy. The one who seems to thrive on drama. If you could just "fix" that person, everything would be better. But we can't fix other people--we can only make choices about ourselves. In this cut-to-the-chase book, communication expert Mike Bechtle shows readers that they don't have to be victims of other people's craziness. With commonsense wisdom and practical advice that can be implemented immediately, Bechtle gives readers a proven strategy to handle crazy people. More than just offering a set of techniques, Bechtle offers a new perspective that will change readers' lives as they deal with those difficult people who just won't go away.

The Number Sense

How the Mind Creates Mathematics, Revised and
Updated Edition

Oxford University Press Our understanding of how the human brain performs mathematical calculations is far from complete, but in recent years there have been many exciting breakthroughs by scientists all over the world. Now, in The Number Sense, Stanislas Dehaene offers a fascinating look at this recent research, in an enlightening exploration of the mathematical mind. Dehaene begins with the eye-opening discovery that animals--including rats, pigeons, raccoons, and chimpanzees--can perform simple mathematical calculations, and that human infants also have a rudimentary number sense. Dehaene suggests that this rudimentary number sense is as basic to the way the brain understands the world as our perception of color or of objects in space, and, like these other abilities, our number sense is wired into the brain. These are but a few of the wealth of fascinating observations contained here. We also discover,

for example, that because Chinese names for numbers are so short, Chinese people can remember up to nine or ten digits at a time--English-speaking people can only remember seven. The book also explores the unique abilities of idiot savants and mathematical geniuses, and we meet people whose minute brain lesions render their mathematical ability useless. This new and completely updated edition includes all of the most recent scientific data on how numbers are encoded by single neurons, and which brain areas activate when we perform calculations. Perhaps most important, The Number Sense reaches many provocative conclusions that will intrigue anyone interested in learning, mathematics, or the mind. "A delight." --Ian Stewart, New Scientist "Read The Number Sense for its rich insights into matters as varying as the cuneiform depiction of numbers, why Jean Piaget's theory of stages in infant learning is wrong, and to discover the brain regions involved in the number sense." --The New York Times Book Review "Dehaene weaves the latest technical research into a remarkably lucid and engrossing investigation. Even readers normally indifferent to mathematics will find themselves marveling at the wonder of minds making numbers." --Booklist

The Number Sense : How the Mind Creates Mathematics

How the Mind Creates Mathematics

Oxford University Press, USA Our understanding of how the human brain performs mathematical calculations is far from complete. But in recent years there have been many exciting scientific discoveries, some aided by new imaging techniques--which allow us for the first time to watch the living mind at work--and others by ingenious experiments conducted by researchers all over the world. There are still perplexing mysteries--how, for instance, do idiot savants perform almost miraculous mathematical feats?--but the

picture is growing steadily clearer. In *The Number Sense*, Stanislas Dehaene offers general readers a first look at these recent stunning discoveries, in an enlightening exploration of the mathematical mind. Dehaene, a mathematician turned cognitive neuropsychologist, begins with the eye-opening discovery that animals--including rats, pigeons, raccoons, and chimpanzees--can perform simple mathematical calculations, and he describes ingenious experiments that show that human infants also have a rudimentary number sense (American scientist Karen Wynn, for instance, using just a few Mickey Mouse toys and a small puppet theater, proved that five-month-old infants already have the ability to add and subtract). Further, Dehaene suggests that this rudimentary number sense is as basic to the way the brain understands the world as our perception of color or of objects in space, and, like these other abilities, our number sense is wired into the brain. But how then did the brain leap from this basic number ability to trigonometry, calculus, and beyond? Dehaene shows that it was the invention of symbolic systems of numerals that started us on the climb to higher mathematics, and in a marvelous chapter he traces the history of numbers, from early times when people indicated a number by pointing to a part of their body (even today, in many societies in New Guinea, the word for six is "wrist"), to early abstract numbers such as Roman numerals (chosen for the ease with which they could be carved into wooden sticks), to modern numbers. On our way, we also discover many fascinating facts: for example, because Chinese names for numbers are so short, Chinese people can remember up to nine or ten digits at a time--English-speaking people can only remember seven. Dehaene also explores the unique abilities of idiot savants and mathematical geniuses, asking what might explain their special mathematical talent. And we meet people whose minute brain lesions render their mathematical ability useless--one man, in fact, who is certain that two and two is three. Using modern imaging techniques (PET scans and MRI), Dehaene reveals exactly where in the brain numerical calculation takes place. But perhaps most important, *The Number Sense* reaches many provocative conclusions that will intrigue anyone interested in mathematics or the mind. Dehaene argues, for instance, that many of the difficulties that children face when learning math, and which may turn into a full-blown adult "innumeracy," stem from the architecture of our primate brain, which has not evolved for the purpose of doing mathematics. He also shows why the human brain does not work like a computer, and that the physical world is not based on mathematics--rather, mathematics evolved to explain the physical world the way that the eye evolved to provide sight. A truly fascinating look at the crossroads where numbers and neurons intersect, *The Number Sense* offers an intriguing tour of how the structure of the brain shapes our mathematical abilities, and how our mathematics opens up a window on the human mind.

Linear Algebra

A Modern Introduction

David Poole's innovative book emphasizes vectors and geometric intuition from the start and better prepares students to make the transition from the computational aspects of the course to the theoretical. Poole covers vectors and vector geometry first to enable students to visualize the mathematics while they are doing matrix operations. With a concrete understanding of vector geometry, students are able to visualize and understand the meaning of the calculations that they will encounter. By seeing the mathematics and understanding the underlying geometry, students develop mathematical maturity and can think abstractly when they reach vector spaces. Throughout the text, Poole's direct conversational writing style connects with students, and an abundant selection of applications from a broad range of disciplines clearly demonstrates the relevance of linear algebra.

Objective Prosperity

How Behavioral Economics Can Improve Outcomes for You, Your Business, and Your Nation

Rothstein Publishing Regardless of how you earn a living, you have likely taken time during the pandemic to take stock of where you are and where you want to be in the future. These evaluations inevitably lead to the question: “How do I get there?” The answers may seem hard to find at times, and for a good reason. Every person comes from a different background, with different skillsets, constraints, weaknesses, and strengths. Identifying ways to increase your prosperity is made even more challenging by the reality that the success of your nation’s economy can have a dramatic effect on your own success. Politicians, prickly pundits, and pompous TV personalities will promise answers for you and your nation, but consider this: Are there really one-size-fits-all answers to improve prosperity? To be clear, this is not a book of simple answers to all of the world’s problems. There are certainly enough “expert opinions” on the planet to go around. Instead, this book provides a method for you to arrive at your own answers not driven by upcoming elections and TV ratings. Throughout the text, there will be a number of explanations, recommendations, and examples to identify solutions to improve your own prosperity and to evaluate the policies that seek to improve the economy around you. If you want to get the most out of this book, consider a few ground. First, try to approach the examples with as little bias as possible. Consider that this is far easier said than done. Biases, positive or negative, are learned predispositions to the environment around us. Just like every person has different strengths and weaknesses, every person also comes with different biases. Strong beliefs about the way things should be should not stop you from being able to evaluate a situation thoroughly and carefully. This book provides a behavioral-economics-based (data-based) view of prosperity that avoids the pitfalls of using preformed opinions and subsequent biases. In short, drop the dogma and dig into the data! Second, this book will walk you through the opinions of multiple sources. Evaluation of the authoritative opinions of others allows you access to valuable information you may not otherwise consider. However, like every person, these sources will frequently have a slant to them (politically or otherwise), and yes, some may even include false or misinterpreted information! To help maintain objectivity, you should consider sources from different perspectives, not just those

you are most comfortable with. The frequent quotes and references in the text provide further resources, but also highlight the importance of evaluating expert opinions in drawing conclusions for yourself. In addition to the above, each chapter includes a few “Keys to Prosperity.” These examples, quotes, and discussions are provided as practical insights from the authors. Consider these a base point to work from as you evaluate your own situation, the situation of those around you, the current state of your nation’s economy, and how you might take action to improve your prosperity in light of these things!

Unlocking the Power of Networks

Keys to High-Performance Government

Brookings Institution Press The era of strict top-down, stovepiped public management in America is over. The traditional dichotomy between public ownership and privatization is an outdated notion. Public executives have shifted their focus from managing workers and directly providing services to orchestrating networks of public, private, and nonprofit organizations to deliver those services. Unlocking the Power of Networks employs original sector-specific analyses to reveal how networked governance achieves previously unthinkable policy goals. Stephen Goldsmith and Donald F. Kettl head a stellar cast of policy practitioners and scholars exploring the potential, strategies, and best practices of high-performance networks while identifying next-generation issues

in public-sector network management. They cover the gamut of public policy issues, including national security, and the book even includes a thought-provoking look at how jihadist terrorists use the principles of network management to pursue their goals. Contributors: William G. Berberich (Virginia Tech), Tim Burke (Harvard University), G. Edward DeSeve (University of Pennsylvania), William D. Eggers (Manhattan Institute), Anne M. Khademian (Virginia Tech), H. Brinton Milward (University of Arizona), Mark H. Moore (Harvard University), Paul Posner (George Mason University), Jörg Raab (Tilburg University), and Barry G. Rabe (University of Michigan).
